Confronting Nested Canalizing Functions with Compiled Data

In order to compare compiled and generated distributions of rules, we must ensure that every nested canalizing function is always represented by the same set of parameters I_1, \dots, I_K and O_1, \dots, O_K (see Appendix in the printed article). All ambiguities in the choice of the representation can be derived from the following operations:

1. The transformation $I_K \rightarrow \text{NOT } I_K$ together with $O_K \rightarrow \text{NOT } O_K$ and $O_{\text{default}} \rightarrow \text{NOT } O_{\text{default}}$.
2. Permutations among a set of inputs i_m, \dots, i_{m+p} such that $O_m = \dots = O_{m+p}$. The values of I_m, \dots, I_{m+p} are permuted in the same way as i_m, \dots, i_{m+p} .

A unique representation is created from any choice of parameters in two steps. First, 1. is applied if $O_K \neq O_{K-1}$, which ensures that $O_K = O_{K-1}$. In order to handle the special case $K = 1$ in a convenient way we define $O_0 = \text{FALSE}$. Second, all intervals of inputs i_m, \dots, i_{m+p} such that 2. can be applied are identified and permuted so that $I_m = \dots = I_{m+q} = \text{FALSE}$ and $I_{m+q+1} = \dots = I_{m+p} = \text{TRUE}$ for some q , $0 \leq q \leq p$.

Using the above described procedure, we can compare a generated rule distribution with the compiled distribution. First, we take away all redundant inputs of each observed rule. An input is redundant if the output is never dependent on that input. Starting from 66, 45 and 22 nested canalizing rules with 3, 4 and 5 inputs respectively, the reduction renders 2, 9, 71, 35 and 16 such rules with 1, 2, 3, 4 and 5 inputs respectively. Second, we let $\alpha = 7$ and generate rule distributions for each number of inputs. ($\alpha = 7$ is not based on a precise fit, it was picked by hand to fit the distribution of I_1, \dots, I_K .) Table 1 shows the result for the most frequently observed rules, and Fig. 5 is a plot of the full rule distribution. The calculated distribution fits surprisingly well to the compiled one, considering that the model has only one free parameter, α .

	n_{obs}	n_{calc}	$(I_1 \rightarrow O_1), \dots, (I_K \rightarrow O_K)$	Boolean expression
A	30	28	$(0 \rightarrow 0), (0 \rightarrow 0), (0 \rightarrow 0)$	$i_1 \text{ AND } i_2 \text{ AND } i_3$

P	2	2	$(0 \rightarrow 0)$	i_1
q	2	4	$(0 \rightarrow 0), (0 \rightarrow 0), (1 \rightarrow 0), (1 \rightarrow 0)$	$i_1 \text{ AND } i_2 \text{ AND NOT } (i_3 \text{ OR } i_4)$

Table 1: The list of nested canalizing rules observed more than once in [1]. n_{obs} is the number of observations in the compiled list of rules, whereas n_{calc} is the average number of rules in the generated distribution. Each rule is described both as an ordinary Boolean expression, and with the parameters I_1, \dots, I_K and O_1, \dots, O_K , where $O_{\text{default}} = \text{NOT } O_K$. 0 and 1 correspond to FALSE and TRUE, respectively. The labels serve as references in Fig. 5, and capital labels mark rules that are chain functions. (NOT has higher operator precedence than AND, whereas the precedences of OR and XOR are lower.)

Table 2: Continuation of Table 1, containing the remainder of rules listed in [1]. The Boolean function $(2 \leq)$ is TRUE if at least two of its arguments are TRUE.

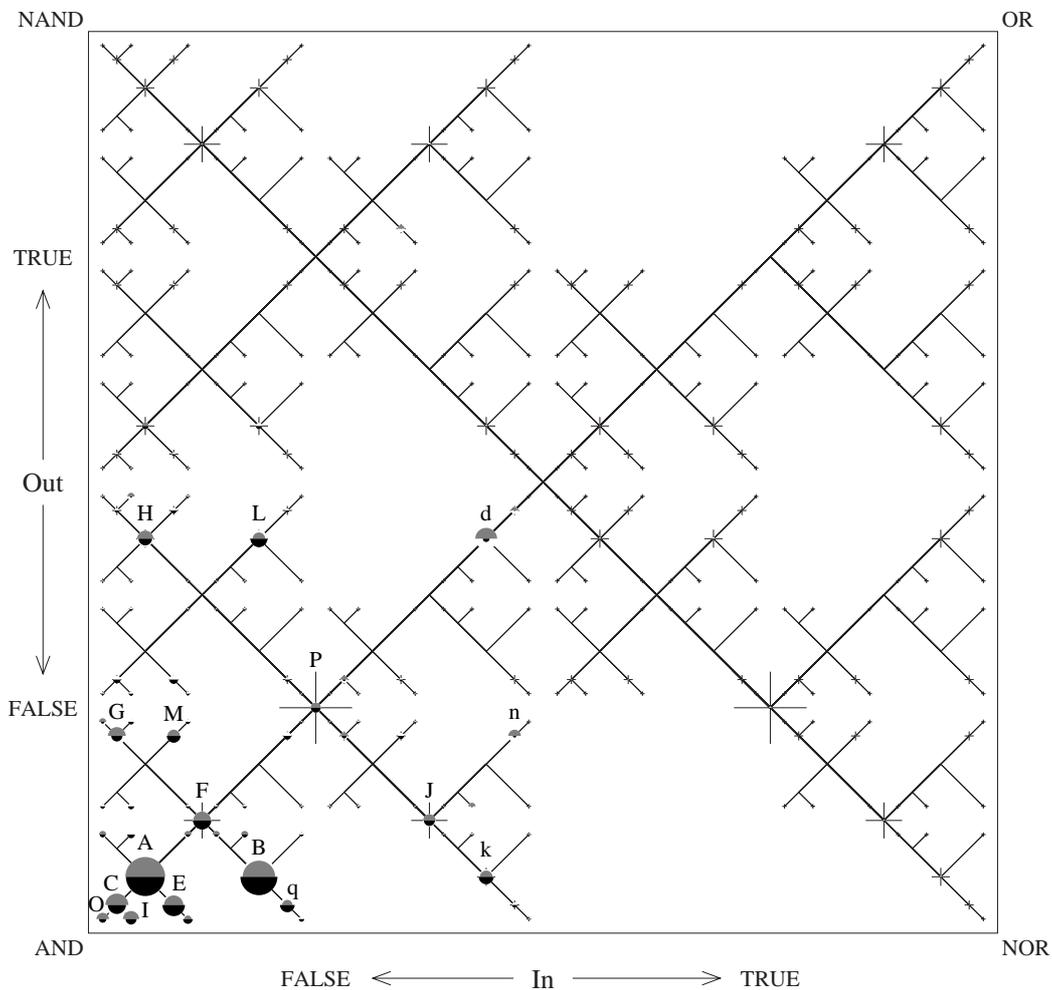

Figure 5: Compiled and generated rule distributions of nested analyzing functions. The gray half-circles have an area proportional to the number of times each rule has been observed, while their black counterparts reflect the calculated distribution. The labeled rules are listed in Table 1. Capital labels mark rules that are chain functions. Each rule is assigned a coordinate in the unit square above (having $(0, 0)$ as its lower left corner), according to $x = 1/2 + \sum_{m=1}^K 2^{-m} \phi(I_m)$, $y = 1/2 + \sum_{m=1}^K 2^{-m} \phi(O_m)$, where $\phi(\text{TRUE}) = 1/2$ and $\phi(\text{FALSE}) = -1/2$. The crosses mark the possible coordinates for a rule that is represented in its unique form. The lines indicate how the coordinates can change when new inputs are added to an existing rule.
